

Retentix

Deterministic GDPR Execution Engine for Engineering-Led Teams

What It Is

Retentix is a headless execution engine that enforces GDPR compliance directly on production databases.

It executes **data retention**, **right-to-be-forgotten (RTBF / erasure)**, and **field-level masking** in a deterministic and auditable way.

This is not a dashboard, scanner, or SaaS platform. It is an execution engine designed to be trusted in production.

The Problem

Most GDPR and compliance tools focus on visibility:

- dashboards
- data discovery
- reporting

However, the **actual legal actions** — deletions, anonymization, and retention enforcement — are still:

- manual
- error-prone
- inconsistently audited

This creates operational and legal risk for both **Engineering** and the **Data Protection Officer (DPO)**.

The Solution

Retentix treats compliance as code.

Compliance rules are:

- explicitly defined as policies
- validated before execution
- executed as one-shot, deterministic jobs

Every run either:

- completes successfully, or
 - fails fast *before* any side effects occur
-

What Retentix Does

- Time-based data retention execution
 - Deterministic RTBF (erasure) with explicit cascades
 - Field-level anonymization (hashing, nulling)
 - Dry-run by default
 - Full, tamper-evident audit logs
-

What Retentix Does Not Do

- No UI or dashboards
 - No data discovery or scanning
 - No background services or agents
 - No SaaS dependency or phone-home behavior
-

Why CTOs and DPOs Choose Retentix

- Deterministic and auditable execution
 - Minimal operational surface
 - Suitable for CI/CD, cron jobs, and air-gapped environments
 - Clear separation between **policy**, **execution**, and **audit**
-

Commercial Model

Retentix is licensed annually per environment.

Typical enterprise customers pay:

- **€45k / year** — Professional
- **€90k+ / year** — Enterprise

Pricing reflects the **legal and operational risk** the engine mitigates.

Bottom Line

Retentix is not a compliance dashboard.

It is a **deterministic GDPR execution engine** that:

- Engineering teams can trust
 - DPOs can sign off on
 - Auditors can verify
-
